# Wentao Zhang

- E-mail: wentao.zhang@nottingham.ac.uk · Tel: (+44) 7402 114 543
- Date of Birth: Nov. 1995 · Address: Suzhou, China

## Work Experience

**University of Nottingham** 2025/09 - Now

Research Assistant Nottingham, United Kingdom

- Power Electronics and Machines Centre (PEMC)

## Education

**Southeast University** 2021/09 - 2025/09

Ph. D. in Electrical Engineering Nanjing, Jiangsu, China

- Dissertation Title: "Multi-physics Analysis and Design of Hairpin Winding PM Traction Machines in Electric Vehicles"
- 2025 1st Prize, IEEE TEC Electric Vehicle Design Competition
- 2025 2nd Prize Paper Award, IEEE Transactions on Transportation Electrification

**Southeast University** 2018/09 - 2021/06

Master in Electrical Engineering Nanjing, Jiangsu, China

- Dissertation Title: "Analysis and Design of High-Performance Wound-Excited Magnetic Field Modulation-based Brushless Machines"

**Southeast University** 2014/09 - 2018/06

B.Eng in Electrical Engineering Nanjing, Jiangsu, China

- Dissertation Title: "Comparative Study of Control Systems for PM Machine in Electric Vehicles"

## Research Experience

**My research develops physics-grounded, hybrid AI methods for modeling, simulating, and optimizing electrified power and propulsion systems**, combining first-principles multi-physics finite-element analysis (coupled electromagnetic, thermal, fluid, and structural) with **deep-learning neural surrogates** and full-scale hardware validation of industrial prototypes. I have authored 22 journal papers, including seventeen published IEEE Transactions papers and one more in early access, 18 peer-reviewed conference papers, and 9 patents. The work spans four interconnected areas that map directly onto the **Physical AI** agenda.

My work on **physics-informed surrogate modeling for physical-system design** develops an **implicit-physics deep-learning surrogate** that maps device design parameters to the full magnetic vector potential field, reaching $R^2$ = 0.9996 for average torque and 0.9730 for iron loss while reducing inference time by more than 94% against direct finite-element analysis. It is built on an **in-house Python finite-element code package** spanning electromagnetic, structural-modal, and mechanical-stress analysis, and it supports rapid design-space exploration and **AI-assisted multi-objective optimization** of electrified power components, a concrete instance of bridging governing equations, simulation, and data. My work on **multi-physics modeling and thermal management** develops high-resolution lumped-parameter thermal networks and fluid-solid coupled oil-cooling models for hairpin-winding PM machines, **validated against AVL dynamometer measurements**, providing the hardware-anchored reduced-order models that underpin digital-twin and condition-monitoring workflows. My work on **control-oriented dynamic modeling and converter-machine interaction** covers spatial-harmonic inductance modeling, DC winding current dynamics under PWM excitation, and converter-machine interaction analysis, providing the first-principles plant models that underpin model-based and model-predictive control of **power-electronic drive systems**. My work on **manufacturing-ready powertrain architectures** develops the *n*-layer flat-wire and hairpin winding design methodology for high power-density PM machines, including conductor-layout optimization, tolerance-aware mechanical design, and full prototype validation, closing the design-build-test loop.

**Industrial development experience.** In partnership with Inovance, a world-leading EV traction-machine supplier, I delivered two oil-cooled PM traction machines through a full industrial cycle: an 18 000 rpm 113 kW A0-class machine (138 Nm, 7.78 kW/kg, 95.3% peak efficiency) and a 20 000 rpm 270 kW A-class machine (380 Nm, 7.87 kW/kg, 97.4% peak efficiency), each taken from multi-physics design through engineering-drawing release and AVL-dynamometer characterization across the full efficiency map.

**Software and toolchain.** Python scientific-computing stack with an in-house finite-element code package (electromagnetic, structural-modal, mechanical-stress) and PyTorch deep-learning surrogates; MATLAB/Simulink for system-level powertrain simulation and control-algorithm prototyping; C/C++ embedded firmware for TI C2000 and STM32 motor-drive controllers; ANSYS Maxwell and Mechanical; hands-on power-electronics prototyping (three-phase full-bridge converter).

## Research Publication

## Academic Service

- **Co-Organizer and Co-Chair**, ICEM 2026 Special Session on "Next-Generation Electrified Transport: Advances in Electric Drive System", with Dr. Lingyun Shao (NUAA), Funchal, Madeira, Portugal, Sep. 2026.
- Peer reviewer for IEEE journals, including *IEEE Trans. Industry Applications*, *Energy Conversion*, and *Transportation Electrification*.

## Awards

- 2025 1st Prize, IEEE TEC Electric Vehicle Design Competition
- 2025 2nd Prize Paper Award, IEEE Transactions on Transportation Electrification
- 2024 2nd Prize in 11th Energy Equipment Innovative Design Competition for China Postgraduate
- 2023 **Wiscom System Scholarship**
- 2023 1st Prize Academic Scholarship
- 2023 CIEEC Best Paper Award
- 2023 **1st Prize in IEEE IAS CMD Thesis Contest (non-Ph. D)**
- 2022 Outstanding Master Degree Thesis in Jiangsu Province
- 2017 2nd Prize in Southeast University Smart Car Competition
