- Address: Nottingham, United Kingdom · Date of Birth: Nov. 1995 · Google Scholar

Work Experience

University of Nottingham 2025/09 - Now

Research Assistant Nottingham, United Kingdom

- Power Electronics and Machines Centre (PEMC), a leading research group for transport electrification and electric aircraft propulsion
- Working on next-generation magnet-free synchronous machines within the Sustainable Multi-Sector Electrification Using Advanced Integrated Motor Drive Technologies (AIMD) programme (Nottingham, Bristol, Newcastle)
- Developing an in-house finite element analysis code package for electromagnetic, structural modal, and mechanical stress analyses of electrical machines
- Extending operator-learning neural surrogates (deep learning-based magnetic field models) to replace expensive FEA evaluations, enabling rapid design-space exploration and topology trade studies

Education

Southeast University 2021/09 - 2025/09

Ph. D. in Electrical Engineering Nanjing, Jiangsu, China

- Dissertation Title: "Multi-physics Analysis and Design of Hairpin Winding PM Traction Machines in Electric Vehicles"
- 2025 1st Prize, IEEE TEC Electric Vehicle Design Competition
- 2025 2nd Prize Paper Award, IEEE Transactions on Transportation Electrification

Southeast University 2018/09 - 2021/06

Master in Electrical Engineering Nanjing, Jiangsu, China

- Dissertation Title: "Analysis and Design of High-Performance Wound-Excited Magnetic Field Modulation-based Brushless Machines"

Southeast University 2014/09 - 2018/06

B.Eng in Electrical Engineering Nanjing, Jiangsu, China

- Dissertation Title: "Comparative Study of Control Systems for PM Machine in Electric Vehicles"

Research Experience

My research focuses on the integration of AI/ML into electrical engineering, multi-physics modelling, and the design of electrified drive systems for net-zero transport, combining strongly coupled electromagnetic, thermal, fluid and mechanical finite-element analysis with deep-learning surrogate models, GPU-accelerated scientific computing, and full-scale dynamometer validation of industrial prototypes. I have authored 22 journal papers, including seventeen published IEEE Transactions papers and one more in early access, 18 peer-reviewed conference papers, and 9 patents. The work covers four interconnected research areas of the electrified-drive-system agenda.

My work on **AI/ML to accelerate traditional computational workflows** develops an implicit-physics deep-learning surrogate that maps machine design parameters to the magnetic vector potential field, reaching R^2 = 0.9996 for average torque and 0.9730 for iron loss while reducing inference time by more than 94% against direct finite-element analysis on low-cost GPU hardware, built on an in-house Python finite-element code package covering electromagnetic, structural-modal and mechanical-stress analyses, and supporting rapid design-space exploration, **data-centric design databases** and AI-assisted multi-objective optimisation (a published physics-grounded optimisation framework reduces a 67-hour FE optimisation to 2.3 hours). My work on **multi-physics design and thermal management of EV traction machines** develops high-resolution lumped-parameter thermal networks and fluid-solid coupled oil-cooling models for hairpin-winding PM machines, validated against AVL dynamometer measurements, addressing efficiency, loss distribution and thermal-degradation limits across the full operating map. My work on **manufacturing-ready powertrain architectures** develops the *n*-layer flat-wire and hairpin winding design methodology for high power-density EV PM machines, including conductor-layout optimisation, mechanical and tolerance-aware design, and full prototype validation. My work on **drive-system dynamic modelling and converter-machine interaction** covers spatial-harmonic inductance modelling, DC

winding current dynamics under PWM excitation, and converter-machine interaction analysis for wound-field and PM machine systems, providing the control-oriented plant models that underpin model-based control of electrified drives.

Industrial development experience. In partnership with Inovance, a world-leading EV traction-machine supplier, I designed, prototyped and tested two high-speed oil-cooled PM traction machines through full industrial development cycles: a 20,000 rpm machine for an A-class vehicle (measured peak power 270 kW, peak torque 380 Nm, power density 7.87 kW/kg, max efficiency 97.4%) and an 18,000 rpm machine for an A0-class vehicle (measured peak power 113 kW, peak torque 138 Nm, power density 7.78 kW/kg, max efficiency 95.3%). At the design stage I built a multi-physics optimisation framework integrating electromagnetic FEA, lumped-parameter thermal network modelling and mechanical stress evaluation. At the manufacturing stage I produced engineering drawings and tolerance specifications for electromagnetic and structural components, and gained working knowledge of stator manufacturing processes (hairpin winding forming, lamination stacking, varnish impregnation) through the prototype builds. At the testing stage I characterised both prototypes on an AVL dynamometer, extracting efficiency maps, key performance indicators and voltage/current waveforms.

Software and toolchain. MATLAB/Simulink for system-level powertrain simulation and control algorithm prototyping; C/C++ for TI C2000 and STM32 motor-drive controllers; in-house Python FE code package (electromagnetic, structural-modal, mechanical-stress); deep-learning surrogate in PyTorch; JMAG, ANSYS Maxwell and Motor-CAD for machine electromagnetic and thermal design; ANSYS Mechanical for structural analysis; hands-on power-electronics prototyping (three-phase full-bridge converter).

Teaching and Mentoring

Teaching Assistant, Southeast University during Ph. D.

Postgraduate course "Integrated Practice of Electrical Machine Systems" Nanjing, China

- Prepared and delivered tutorial slides; ran daily Q&A and consultation hours
- Reviewed student final-project proposals with structured written feedback on scope and methodology; provided mark recommendations to the course coordinator

- Mentored junior Ph. D. and MSc students in the SEU electrical machines group on multi-physics modelling, finite-element analysis and thermal-network construction, leading the technical formulation on multiple jointly authored journal and conference papers
- Continuing informal mentoring of junior research students at PEMC, University of Nottingham

Research Publication

Transaction/Journal Paper (22 papers, 17 in IEEE Transactions)

Academic Service

- **Co-Organiser and Co-Chair**, ICEM 2026 Special Session on "Next-Generation Electrified Transport: Advances in Electric Drive System", with Dr. Lingyun Shao (NUAA), Funchal, Madeira, Portugal, Sep. 2026.
- Peer reviewer for IEEE journals, including *IEEE Trans. Industry Applications*, *Energy Conversion*, and *Transportation Electrification*.

Awards

- 2025 1st Prize, IEEE TEC Electric Vehicle Design Competition
- 2025 2nd Prize Paper Award, IEEE Transactions on Transportation Electrification
- 2024 2nd Prize in 11th Energy Equipment Innovative Design Competition for China Postgraduate
- 2023 **Wiscom System Scholarship**
- 2023 1st Prize Academic Scholarship
- 2023 CIEEC Best Paper Award
- 2023 **1st Prize in IEEE IAS CMD Thesis Contest (non-Ph. D)**
- 2022 Outstanding Master Degree Thesis in Jiangsu Province
- 2017 2nd Prize in Southeast University Smart Car Competition
